

The Game Factory

Same-Day Slice Doctrine — how Claude names a game, tears down the live top of the genre, dresses a legal lookalike slice, tests it through Studio MCP, and puts a stranger-ready model in front of you before the day ends.

v1.2 designed a factory that learns. It also designed a factory that waits. This addendum does not throw v1.2 away. It answers a new owner instruction: make Claude aggressive enough that a named idea becomes a dressed, MCP-tested, metric-ready slice in one working day — using the shapes, colour language, HUD density and appointment rhythm of the games that currently hold attention — without ripping meshes, audio, names or scripts that will get the title deleted the week it starts earning.

FIELD	VALUE
STATUS	Addendum to FACTORY_PLAN.md v1.2. Where they fight on speed, this file wins. Where they fight on safety, money, or publishing, v1.2 and ROBLOX_SUCCESS_LOGIC.md win.
WRITTEN	13 September 2026. Same night as the owner's request: name → top comps → copy the shape legally → MCP-test → marketable model in <1 day.
FOR	Justin (owner) · Hunter (playtest ops) · every future Claude session. Drop \$6–\$8 into CLAUDE.md and skills/ as standing orders.
NOT THIS	Rip another creator's place. Clone one source. Automate G5. Spend before Gate B. Treat D1 as a same-day number — it is not.

The one-paragraph answer

Yes — Claude can produce a workable, visually competitive slice in one day if three things become defaults instead of aspirations: (1) the research step is a ranked teardown of 3–10 live comps by CCU, not a blank-page invention; (2) the cut happens automatically to the complexity budget and Justin only moves the line; (3) the build is not done until Studio MCP has played join → first earn → first spend → first upgrade with a clean console and screenshots in the run log. What one day cannot produce is Day-1 return. List the place before you sleep. Read D1 tomorrow. That is still the only number that decides more energy.

PART 0 · DIAGNOSIS

What v1.2 already got right — and what is blocking the one-day goal

v1.2 is a strong factory constitution. It correctly separates factory from title, refuses client-authoritative economy, refuses stolen IP, forces a closeout, and treats Justin's job as the cut rather than invention. None of that changes. The failure mode relative to the new goal is not ethics. It is latency. Too many of the steps that turn four paragraphs into a playable model are marked MISSING, and the standing rule after v1.2 was "no more system work until Fat Man Gets Rich clears Gate A." That rule protected the project from becoming a document about itself. The owner has now overridden it for one purpose: automate the path from idea to testable model.

The five bottlenecks that make "create a game" slower than a day

BOTTLENECK IN v1.2	WHAT IT DOES TO SPEED	v1.3 DEFAULT
Intake agent MISSING	Claude waits for a filled six-question brief instead of drafting it from four paragraphs	Paragraphs in → brief drafted in 10 minutes. Justin corrects; silence after 20 min = accept draft.
Top-three teardown is a night of work, done by hand	Research becomes the project. The slice never starts.	Comp hunter agent pulls 3–10 live titles by CCU in the same genre in one pass. Fixed template. No essay.
Expansion + cut-list generator MISSING	Claude either bloats the slice or stops to ask which features to keep	Budget auto-cuts. Ranked list written. Line pre-drawn. Justin has 2 minutes; silence = keep the line.
MCP playtest AVAILABLE, not wired	"Built" means code on disk. Nobody has proof a stranger can finish the loop.	A slice is not done until MCP runs the four-beat scenario and writes screenshots + console to the run log.
Shelf blocked on unlisted publish	InsertService and DataStores are dark until Justin's three clicks. Grey box cannot produce real metrics.	Day-zero human click is the unlisted publish + Studio API access. Everything else in the day assumes that click already happened once per title.

What one day can and cannot claim

Be exact, or the factory will lie to itself. A same-day slice can look like the genre, play the genre's verb, teach the bank, fire one appointment hook, take a first spend, and survive a server restart. It can go listed at night and start collecting cold impressions. It cannot produce a trustworthy D1, D7, or spend-day number before morning. Roblox discovery now pays for return, not first clicks. Treat same-day MCP pass + first-session completion as the go/no-go for listing. Treat D1 at ~24 hours after listing as the go/no-go for more energy. Do not spend on ads the night you publish.

Honesty rule

If a session claims "marketable in one day," it must mean: dressed, loop-complete, MCP-green, listed or list-ready, instrumented. It must not mean: proven evergreen, DevEx-positive, or safe to buy traffic. Those are Gate B and Gate C numbers. Compressing them into a slogan produces bad kills and worse spends.

PART 1 · THE SAME-DAY CLOCK

Hour-by-hour: name → comps → cut → build → MCP → list-ready

This is the aggressive path. It assumes the engine already exists (it does), the hooks already refuse R1–R7 (they do), and one unlisted place with Studio API access is available (Justin's three clicks — do this once per title at hour 0 if it is not already done). Grok runs the confusion pass and art-sheet pass in parallel. Claude is the only writer to src/ and the live DataModel.

HOUR	MOVE	OUTPUT THAT UNBLOCKS THE NEXT HOUR	HUMAN
0:00–0:20	Name + four paragraphs + intake	games/<slug>/brief.md drafted from prose. Ledger queried for this genre. STATE.md set to Active.	Justin: name + 4 paragraphs. Silence on the draft brief = accept.
0:20–1:20	Comp hunter: 3–10 live titles	research/patterns/<slug>-board.md — ranked by CCU, wave stage, first 60s, verb, meta, social, prices, complaints, style, Store equivalents, COPY / DO NOT COPY.	None. G1 is auto-picked as the highest-scoring pitch unless Justin interrupts.
1:20–1:50	Expand + auto-cut	Ranked cut list with the line drawn at the budget. Parking list. Style spec (5 lines). Creator Store shelf (≥15 free IDs). Two hypotheses.	Justin: 2 min to move the line. Silence = keep Claude's line.
1:50–2:00	G2 numbers	Economy workbook + Monte-Carlo. Default: Candidate pattern that does not exhaust by day 3.	Justin: one-line approve. Silence 20 min = Candidate default.
2:00–6:00	Build the slice	Content pack on the engine: one verb, one return hook, one clip hook, ≤4 systems, ≤3 HUD numbers, onboarding artifact, theme + world wired to Store IDs.	None. Hooks refuse illegal writes.
6:00–7:00	Dress + persist	Shelf inserted by ID. Audio from Store library only. Persistence test 7-row. Grey box is no longer the deliverable.	Only if publish/API is still off — three clicks.
7:00–8:00	MCP four-beat test	Run log: join → first earn → first spend → first upgrade, console clean, screenshots, no softlock, save survives restart.	None. Fail = stop-and-patch, do not declare done.
8:00–9:00	Icon / thumb / one shot	200px-readable icon and thumbnail: one face, one giant collectable, ≤3 words. Generated in the blended style. No owned names.	G4: approve or reject. Silence 30 min after first pair = ship the pair.
9:00+	List-ready packet	Gate A script printed for Hunter. Soft-launch checklist. Listing is still a G5 human click. After listing, the clock for D1 starts.	G5 click to list. No ads tonight.

If the day slips, cut in this order: second area, trading, rare variants, consumable sinks, gift loops. Never cut: the one verb, the bag-or-equivalent teach, the one return hook, the onboarding artifact, the MCP four-beat, the persistence test. A thin dressed loop that a kid understands beats a rich grey box that nobody finished.

Silence policy (aggressive, still reversible)

Silence means proceed for: brief draft, pitch pick (G1), cut-line, Candidate economy, thumbnail pair, research drops, evidence filing, cap moves justified by a Gate A result. Silence never means proceed for: listing, paid products, ads, killing a live title, lowering a safety rule, spending money. Those wait forever. This is the autonomy contract from v1.2 with the waiting removed from everything that can be undone.

PART 2 · COPY AGGRESSIVELY, SURVIVE MODERATION

How to look like the games that win without becoming the title that gets deleted

The owner's instruction is correct and already in doctrine §3.1: most games in a category look alike because the shape works; blank slates are slow; Claude should copy on sight and let Justin cut. The thing that deletes a title on this platform is not "looking like a tycoon." It is a ripped mesh, a fingerprinted audio file, an owned name, a mascot, or a private-endpoint scrape. Aggression without that distinction is how #1 games disappear in August.

The copy matrix — standing orders

DO THIS UNPROMPTED	NEVER DO THIS	WORKAROUND WHEN YOU WANT THE LOOK
Tear down 3–10 live comps on the fixed template. Blend at least three. Never ship a single-source clone.	Rip meshes, textures, audio or scripts out of another place. That needs exploit tooling, bans the account, and fingerprints.	Search Creator Store by the silhouette ("low poly gold coin pile", "cartoon vault", "market stall"). Insert by asset ID.
Copy verbs, cadence, first 60 seconds, bag-and-bank feel, appointment timers, price-ladder shape, complaint wedges.	Copy names, taglines, mascots, logos, characters with an owner. Peter Griffin-class takedowns land after Gate B.	Rename every tier in-theme. Duffel / Wheelbarrow / Dump Truck is a pattern. "Petegold Pickaxe" is a lawsuit.
Copy HUD density, camera distance, colour logic, VFX cadence, thumbnail formula (one face, one giant object, ≤3 words).	Re-upload "free" Store audio named after another game's sound. Audio is fingerprinted; free is not clear.	Licensed Creator Store library first. Generated SFX only for a sound the Store lacks. No Suno loop as identity audio.
Generate meshes and icons in the style of the blended three using Studio / Cube 3D / Imagine. Those outputs are ours.	Auto-download storefront images to produce a minor-edit derivative that ships.	Reference board stays git-ignored and never ships. It is a mood board for Justin and for prompts, not a source of assets.
Read CCU and visit counts from RoMonitor / Rolimon's / RTrack / RoWatcher.	Hit Roblox private endpoints for the same numbers. Terms-of-service risk for a number a tracker already shows.	Trackers are the research tool. Claude synthesises; it does not scrape the platform.

The 3–10 comp hunt — exact procedure

When the brief names a genre or a verb, Claude does not invent the loop. It pulls the live board.

- Select. Take the top titles by current CCU in the same verb family (bag-and-bank, grow/collect, steal-and-show, simulator, obby-with-meta, etc.). Prefer a mix: 1–2 rising or peak, 1–2 evergreen, 1 fading. A fading #1 is a warning, not a template to photocopy.
- Count. Three is the floor. Ten is the ceiling. Five is the default. More than ten is stalling.
- Same form every time (research/patterns/TEMPLATE.md): numbers and wave stage; first 60 seconds; core verb and cadence; meta loop; social / clip surface; return hook; event rhythm; monetisation catalogue with the first purchase named; player complaints (the wedge); style spec; Creator Store equivalents; two closing lines — COPY THIS / DO NOT COPY THIS.
- Blend, then cut. Every applicable shape goes on the expansion list. The budget auto-cuts to one verb, one return hook, at most one clip hook, at most four player-facing systems, at most three on-screen numbers, one onboarding artifact. Justin moves the line. Everything below the line is parked, never deleted.
- Confusion pass. Grok (or a second Claude pass if Grok is offline) answers one question before the cut is locked: which of these would lose a ten-year-old in the first minute? That item is demoted, not debated.

Visual bar for Phase 1 — "good enough to hold a kid"

v1.2 already said a grey box cannot produce real metrics. Make that a gate, not a hope. Before MCP is run, the slice must satisfy all of these or it is not Phase-1-ready:

BAR	PASS
Silhouette at 200px	Icon and in-world collectable readable as a thumbnail. One dominant object, one accent colour, dark or simple ground.
Colour logic stolen from the blend	Write it in five lines in theme.luau comments: ground, accent, flood/event light, bag meter, bank destination. Then match it.
Destination building	The bank / hive / plot / cage is a building the camera can point at. Not a UI button pretending to be a place.
One big meter	Bag, hunger, heat, or plot — one. A fourth HUD number fails the budget and fails a ten-year-old.
Audio from the shelf	Pickup chime, bank cha-ching, one loop, one event sting. All Store-licensed IDs recorded in the pack.
No owned IP in the DataModel	R6 warn is treated as a block for same-day slices. Rename and regenerate. Do not ship the warning.

PART 3 · MCP IS THE BUILD GATE

A slice that has not been played by the machine is not built

The owner's request is specific: after Claude builds, it uses the Studio MCP server to test the game. v1.2 listed the playtest subagent as AVAILABLE · NOT WIRED. That is now a defect, not a future nice-to-have. The four-beat scenario is the definition of "workable."

The four-beat scenario — must go green before anyone says done

BEAT	WHAT MCP DOES	PASS
1. Join	Start play. Wait for character. Screenshot spawn. Read console.	No error spam. Player can move. Onboarding artifact visible or first pickup is obvious.
2. First earn	Drive the core verb until the first reward registers (bag fills, crop harvested, coin exists).	A number went up within 60 simulated seconds. Screenshot of the meter.
3. First spend / bank	Walk to the destination building or open the shop. Complete earn → sink.	Balance changes server-side. Client cannot edit it (R1). Screenshot of the sink.
4. First upgrade + persist	Buy the first named tier. Stop play. Start play. Confirm the upgrade and currency survived.	DataStore path exercised. Kill-and-rejoin is the test, not a Studio memory store.

Every run writes docs/runs/YYYY-MM-DD-<slug>-mcp.md containing: commands issued, console excerpts, four screenshots, pass/fail per beat, and the one thing a kid would still not understand. Fail any beat → patch in the same session → re-run. Do not hand Justin a "built" slice with a red beat.

Coupling — why the unlisted publish is hour-zero, not week-one

InsertService (the shelf), DataStores (saves), and a real kid on a real build all sit behind the same three clicks: publish unlisted, enable Studio API access, grant the place the permissions the persistence test lists. Do this once per title at the start of the day. Without it, MCP can walk a grey box and lie about persistence. With it, dressing, saving and testing become one path. This is still a human click. Claude prepares the checklist and waits. It does not publish.

Metrics you can honestly take in 24 hours

Same day: MCP four-beat pass rate, first-action time, loop completion in Studio, Hunter's 3-kid comprehension script (if the cohort is free that afternoon), thumbnail readability at 200px. Next morning after listing: impressions, join rate, median first-session length, first-session loop completion, organic spends, D1 once it exists. Do not optimise a thumbnail on night-zero spend. Optimise whether a cold join finishes the loop.

PART 4 · THE UNIFIED CLAUDE PROGRAM

Skills, agents, tasks, memory — one writer, no ceremony

Justin asked for a unified Claude program: skills, agents, tasks, and learning. v1.2 already named most of these and left them MISSING. v1.3 promotes them to standing jobs with a trigger phrase, an input, an output path, and a stop condition. They are not extra workers making extra ore types. They remove waiting.

4.1 Skills to add under roblox-pipeline/skills/

SKILL FILE	TRIGGER	IT FORCES
same-day-slice.md	"create a ___ game", "new title", "same-day", a name + four paragraphs	The hour clock. No research essay. No grey-box deliverable.
comp-hunter.md	Any new brief, any genre word, Monday digest for the active title	3–10 live comps by CCU, fixed template, COPY / DO NOT COPY, Store shelf candidates.
legal-copy.md	Any art, audio, mesh, name, or thumbnail task	The copy matrix. R6 treated as block for Phase 1. Shelf-by-ID. No rips.
studio-mcp.md (extend)	"test the game", end of every build session, before anyone says done	Four-beat scenario. Screenshots. Persistence row. Fail = not done.
cut-list.md	After expansion, before build	Budget as code. Ranked list. Pre-drawn line. Parking list. Two-minute owner window.
onboarding-slice.md	Every first slice, even if the onboarding engine module is not built yet	One artifact: overfill, arrow, or three-line prompt. Teach the verb without a cutscene.
session-close.md	End of every session	What changed, why, files touched, open question, next move. Written before the session dies.

4.2 Agents — narrow jobs, disk handoff, one writer

An agent here is a prompted job Claude (or Grok) runs against a file contract. Grok never writes to src/ or the live DataModel. Two editors in Studio corrupt the place.

AGENT	WHO RUNS IT	IN → OUT	STATUS TO BUILD NEXT
Intake	Claude	4 paragraphs → games/<slug>/brief.md (six questions drafted, hypotheses stubbed)	Do first. This is gap 0.
Comp hunter	Claude + Grok in parallel	brief genre → teardown board + style spec + shelf IDs	Do second. This is the speed engine.
Expansion + cutter	Claude proposes, Grok confusion-pass	board + ledger + budget → ranked cut list + parking list	Do third. Stops bloat.
Builder	Claude only	cut list + engine → content pack, theme, world, sku	Exists. Point it at the cut list, not at invention.
MCP tester	Claude via Studio MCP	running place → four-beat run log	Wire it. Highest leverage after intake.
Onboarding	Claude	verb + first fail-point → one artifact in the pack	Thin version now; engine module after first Gate A.
Closeout / session-close	Claude	gate results + hypotheses → ledger record + STATE.md + CHANGELOG.md	Build the moment the first MCP run exists so evidence has a home.

4.3 Tasks — the only commands a session should accept as completeable work

TASK PHRASE JUSTIN CAN SAY	WHAT RUNS	DONE LOOKS LIKE
"New game: [name]. [four paragraphs]."	Intake → comp hunt → expand/cut → stop with the line drawn	brief.md + board + cut list sitting in front of Justin
"Keep the line. Build."	Builder + dress from shelf + economy sim	Playable pack on disk, wired to IDs
"Test it."	MCP four-beat + persistence rows	Green run log or a patch list
"Make it look like the top games."	legal-copy + style spec + shelf insert + thumb pair	Dressed slice + 200px icon/thumb, no owned IP
"List it."	Checklist only. Claude does not click.	Soft-launch packet. Justin clicks G5.
"Kill it / keep it."	Closeout writer	Hypotheses marked, engine candidates listed, next title can start smarter

4.4 Learning — force the write, or the next session is amnesiac

Claude does not persist between sessions. "The program learns" only means: this session wrote a file the next session is forced to read. v1.2 built SessionStart and the ledger and then left the feeders missing. That is why the factory currently learns about itself and not about players.

- SessionStart already loads CLAUDE.md, STATE.md, the hook list, the latest digest line. Keep it. Add the active title's brief, cut list, and last MCP run log to that load.
- Every title carries 1–2 hypotheses written at intake, specific enough to be wrong. Example: "A timed server-wide flood will produce a clip in the first cold session." Marked at closeout.
- Every MCP run and every Gate A script files an evidence record with the seven context tags. Player evidence finally enters the ledger.
- Session-close hook (missing → now required): a session cannot be considered finished until docs/runs/ records what changed and STATE.md lists the next move. If the model cannot install a hook today, the standing order is: write those two files before you stop. Ritual beats amnesia.
- The ledger still has no veto. A finding from Fat Man Gets Rich cannot block a new verb. It can only seed the expansion list and flag n=1. Defaults require n=2.

PART 5 · MONEY PATH, UNCHANGED AND TIGHTER

Speed serves retention. Speed does not replace it.

The market facts in v1.2 still govern: power-law payouts, discovery that weights return, platform takedowns of forced-engagement #1s, children as the regulated audience, clone waves that die in months. A faster factory that ships coercive shops will get the same August that Steal an Egg got. Aggression is in production and in copying public shapes. It is not in panic timers, pay-to-stop-suffering, simulated gambling, or dark-pattern checkouts.

STAGE	WHAT "WORKING" MEANS	MONEY ACTION
Same-day slice, MCP green	A stranger can finish earn → spend → progress. It looks like the genre.	Zero spend. Optionally list (G5).
Gate A, 3 fresh kids	2 of 3 can say the goal; act in 60s; want a second go.	Zero spend. Patch until they can.
Night-zero listing	Roblox new-experience impressions start. Instrumentation on.	Zero spend. Watch joins and first-session completion.
D1 next day	Doctrine floor ~12%+. Under 8–10% after three honest hook rewrites: kill with closeout.	Still zero. This number decides energy, not ads.
D1 clears	Favourites up, a few organic buys, stable.	Then shorts, then \$20–200 micro-creators, then small tiles on the winning icon only.

Every product still has to map to one of Justin's four drivers: accelerate fun they already have, show status others see, complete a collection, participate socially. If it maps to none, it does not ship — even if the MCP test is green. A green machine and a shop nobody wants is how you burn a wave.

PART 6 · STANDING ORDERS TO PASTE INTO CLAUDE.md

The aggressive block — short enough to load every session

Append this section to roblox-pipeline/CLAUDE.md. Do not replace the safety block. Safety still wins.

Paste block**SAME-DAY SLICE MODE (v1.3)**

1. When Justin names a game and writes four paragraphs, do not ask him to fill a form. Draft brief.md. Query the ledger. Start the comp hunt.
2. Pull 3–10 live comps in the verb family by CCU. Fill TEMPLATE.md. Blend three. Never one-source clone.
3. Propose every applicable shape. Auto-cut to the budget. Draw the line. Park the rest. Wait two minutes. Then build.
4. Copy loops, cadence, HUD density, colour logic, appointment rhythm, thumbnail formula. Insert Store assets by ID. Generate the rest in the blended style. Never rip. Never ship owned names. Treat R6 as a Phase-1 block.
5. You are not done when code compiles. You are done when Studio MCP has a green four-beat run log and persistence survives restart.
6. Grey box is not a deliverable. Dress from the shelf before you call it Phase 1.
7. Silence proceeds on reversible work. Listing, paid products, ads, title-kills and rule-lowering wait for a human click.
8. Write session-close + STATE.md before you stop. File evidence with context. Hypotheses live in the brief.
9. Do not start a second title mid-build because a new idea looks fun. Log it in IDEA_LOG.md and keep building.
10. If this file fights ROBLOX_SUCCESS_LOGIC.md on safety, money, children, or publishing, the doctrine wins.

PART 7 · BUILD ORDER, REVISED

What to construct next so the next title really is a one-day slice

v1.2 froze system work until Fat Man Gets Rich cleared Gate A. The owner has now authorised system work that unblocks the one-day loop. Anything that does not unblock that loop still waits.

#	BUILD THIS	WHY IT IS AHEAD OF EVERYTHING ELSE
1	Unlisted publish + API access for the active title (Justin, three clicks)	Unlocks shelf, DataStores, MCP truth. Without this the day is fake.
2	skills/same-day-slice.md + skills/comp-hunter.md + skills/legal-copy.md + skills/cut-list.md	Turns today's request into standing orders the next session cannot forget.
3	Wire MCP four-beat into studio-mcp.md with a run-log template	Defines "built." Highest leverage remaining in the repo after the publish click.
4	Intake: paragraphs → brief.md writer	Gap 0. The stated purpose of the factory.
5	Session-close writer + hypotheses field in the brief template + closeout template	Learning feeders. Without them the ledger stays a schema.
6	Wire the Fat Man Gets Rich shelf and Candidate C, then Gate A with three fresh kids	Still the first player evidence the factory will ever hold. Do not skip it in favour of a second title.
7	Onboarding as engine module	After Gate A, so we learn what actually needed explaining.
8	Physical factory split / title registry	When title two exists. Not before.

Decisions that remain Justin's

- The three clicks: unlisted publish + Studio API access, once per title.
- G2 on economy numbers when the sim proposes them (Candidate C or successor).
- G4 on the first icon/thumbnail pair if he is in the room; otherwise the 30-minute silence rule applies.
- G5 listing. Always a click. Never inferred.
- Kill or keep after D1. Always a click.
- Confirm that this addendum may override v1.2 on speed and silence, and may not override it on safety, children, or money.

PART 8 · WORKED START LINE

What Claude should do the next time Justin says a name

Example trigger, not a commitment to this title: "New game: Pocket Factory. Kids run a tiny desk-factory that prints toys while they are at school. They come back to a pile, sell, upgrade the printer, and show off the rare toy on a shelf friends can steal-compliment."

Claude's first hour, no questions except the ones that prevent a bad build:

STEP	FILE WRITTEN
Slug it. pocket-factory. Create games/pocket-factory/.	games/pocket-factory/brief.md drafted from the paragraphs. Age band assumed 8–12 unless the prose said otherwise.
Ask the ledger what it knows about offline-progress + collection + social shelf games.	A match.py dump pasted into the brief. n=1 flagged. New ground stated if empty.

STEP	FILE WRITTEN
Pull 5 live comps in the grow / print / collect / show-off family by CCU. Include one fading wave as a warning.	research/patterns/pocket-factory-board.md
Write the five-line style spec and a Store shelf of coin-adjacent and shelf-adjacent free IDs.	games/pocket-factory/theme.md + shelf.md
Expand every applicable shape. Auto-cut. Draw the line at one verb (collect-from-printer), one return hook (offline cap that respects bedtime), one clip hook (rare toy on a public shelf).	games/pocket-factory/cut-list.md
Stop for two minutes with the line drawn. Then build unless Justin moved it.	STATE.md: waiting 2 min on cut, then B.

If Fat Man Gets Rich is still the active title

Do not start Pocket Factory. Finish the persistence click, wire the existing shelf, run MCP four-beat, and get three kids through Gate A. The same-day program is how title two and title three are born. Title one is already mid-pipe. Hopping is the failure mode the doctrine named. Log the new idea in IDEA_LOG.md and keep the slot.

PART 9 · WHAT THIS ADDENDUM REFUSES TO PRETEND

Limits, so the next session cannot launder them

- A one-day slice is not a proven business. It is a dressed experiment that can start collecting the only numbers that matter.
- Looking like Grow a Garden is legal. Being Grow a Garden's asset folder is not. The workaround is Store IDs + generated-in-style + blended specs. There is no workaround that makes a ripped mesh safe.
- MCP can prove the loop works. It cannot prove a kid loves it. Hunter plus three fresh testers remains the instrument for comprehension. Automate smoke. Do not automate taste.
- Grok is a coworker for research, confusion, and art sheets. It is not a second Studio writer.
- More agents are justified only when they remove owner wait or enforce a quality bar. An agent that produces more documents about the factory is the anti-pattern v1.2 already named.
- Platform facts go stale. Re-check discovery weights, DevEx rates, gambling rules and takedown patterns by 12 November 2026.

The test of v1.3 is the same as the test of v1.2

A game in front of a stranger. The difference is the stranger should be able to arrive sooner: same day for a dressed MCP-green slice, next day for D1, not next month for a grey box that was waiting on a brief nobody drafted. Use the factory. Do not add a v1.4 until this path has been run once on a real title.
